Summary (translated from the Italian): "Alfred North Whitehead (1861–1947) is among the most complex and multifaceted thinkers of the 20th century. Nevertheless, his intellectual trajectory still remains, in many respects, little investigated. This volume reconstructs his transition from mathematics to philosophy, with particular attention to the 'epistemological' turn of the 1910s. Through a historical and conceptual analysis, the book restores Whitehead's dialogue with mathematical logic, physics, and philosophy of time, showing how his thinking helped redefine the relationship between philosophy and science. The survey focuses on the tensions and theoretical hubs that have marked the author's career: from his debate with Russell to the influence of Bergson and Bradley, up to his collision with the theory of relativity. A multifaceted and rigorous portrait of Whitehead emerges, doing justice to the complexity of his vision without schematic reductions, and highlighting the originality of an author who reconsidered in depth the link between experience and conceptual elaboration."
